

Q1 2026 Investment Update

Positive Sum Capital III, L.P.

Q1 2026 Update

Dear Partners,

The theme of this quarter is simple: the machine is humming. Across Colossus and Positive Sum, the component parts of our firm are operating together in a way they never have before. The team has shared purpose, clear ownership, real leverage, and the autonomy to run. It feels like we've moved from building the plane to flying it.

On the media side, Colossus continues to hit new highs. We had our biggest podcast episode ever, our biggest profile launch ever, and our short-form clips are driving traffic back to our long-form work. The unifying editorial vision is now clear: Colossus covers tech and finance at the frontier, and everything we produce is to cover building and funding the future. We've always believed Colossus is one of our biggest unfair advantages. It earns us access and insights that feed directly into our investments. If you aren't already, I'd encourage you to subscribe to Colossus' [email newsletter](#). You'll get updates on new episodes and profiles covering investors and operators like Paul Tudor Jones, Cognition CEO Scott Wu, Anthropic CFO Krishna Rao, and Hyperliquid founder Jeff Yan.

We've also made significant investments in internal tooling that lets the entire team build AI-powered applications on top of our data. The result is that everyone, not just the technical team, now has the ability to create tools that help us source opportunities, monitor the portfolio, manage the business, and operate at higher fidelity and cadence. It's already been a force multiplier across the firm; we've already created 50+ applications and used 3Bn+ tokens in just the first couple months of use.

We're also excited about a new initiative that deepens our ability to support companies and founders. Brie Wolfson and Camille Ricketts are now working directly with companies on positioning and storytelling as part of a project we're calling Merlin. This gives us another surface area for meeting interesting companies, while offering a form of sponsorship that we've long wanted to provide and that the market is demanding now more than ever.

The pipeline is as rich as we've ever seen it. Talented founders are taking enormous swings at domains that haven't been reimaged in a long time, with AI as the driving or enabling force. What strikes us is how consistent the energy feels across stages: a company at a \$30 million dollar valuation and one at \$20 billion can feel remarkably similar in ambition and velocity right now. We remain focused on backing founders pursuing their life's work for the long run.

More detail on the portfolio can be found in the fund-specific materials below. As always, thank you for your partnership, and please don't hesitate to reach out with questions, ideas, or feedback.

Warm regards,

PATRICK AND THE POSITIVE SUM TEAM

Firm Update

COLOSSUS

Hi and welcome. This is Positive Sum's Partner Update. This feed is going to provide the latest information on what's happening at the firm and with your investment in the partnership.

ALISON

Welcome to our Q1 LP update. You have myself, Alison, Patrick, and we're also joined by Donald this quarter. We thought we'd start, as we usually do, with an update on the overall state of the firm. There's lots going on as usual. Patrick, do you want to just give a sense for how things are going, how things feel, and what the theme of the quarter has been from your vantage point?

PATRICK

Hard to pin down a specific theme of the quarter, but I would say the feeling that we have as a firm is one of high-performance machine right now. This feels like in the last three to six months, the component parts of what make our firm go are mature and operating in an extremely efficient way, whether that's sourcing, whether that's doing a good job picking which companies to meet, research and all the technology we're building to help us understand companies faster, whether that's an ever further honing of our taste in the type of founders and companies that we're after, whether it's in Colossus, where I feel as though the machine that produces our interviews, our other podcasts, our magazine, our digital publication, are just humming in a way that they've never done before.

We had by far our biggest episode ever on the podcast. We've had a nice resurgence, and we have some further plans for how to make Business Breakdowns great again, which is this huge property that sort of laid dormant for a couple of years as our attention's been elsewhere. We had our biggest profile launch ever in our coverage of Jeff Yan from Hyperliquid in Colossus.

The numbers are all going up and to the right in a way that's explosive and really exciting. We figured out how to do what I would call clippings, literally video clips or short excerpts from pieces that get tons of attention and drive traffic towards the original long form source of content that we've created.

It feels like we are really aligned around Colossus equals coverage of tech and finance at the frontier, like it's that simple, and that we have really successfully moved from our original core of finance really into tech as the unifying theme, and that the people and stories we cover are entirely about building and funding the future.

And all of this aligns in a beautiful way with what we're trying to do at Positive Sum. And so the machine being mature is so exciting because everything just feels like one. There's exciting numbers like I reported, you know, biggest episode, biggest profile. Our hope is that those numbers get dwarfed in the quarters to come, and it feels we're now on that trajectory.

We're not feeling our way through the dark anymore. We know how to do this stuff. I think we're world-class at it. And now it's about improving every component part. So I just feel like Colossus is firing on all cylinders. We do have some ideas that we're exploring for further expansion. We do this very carefully.

We believe deeply in quality, and I think that's what we're known for. When Colossus covers something, people pay attention. We don't want to lose that advantage, but we do feel like this is a moment in time that people will rely on us to understand what's going on, and we want to lean into that.

So it feels like the machine is very well oiled right now. Another way of saying it would be far fewer things happen that get bottlenecked on one person, whether that be me or Jeremy in Colossus or Donald in research or Alison on the firm. I think the team is extremely good, and we have the right people in the right seats, and they've been here long enough now to know how things work and build how things work so that we just have a lot of leverage as a group.

We're often off doing our own work streams. That's how it feels to me. That's how I would articulate the update, that it's never felt like it's working as well as it is right now, and I think that's entirely a function of honing our taste, honing our team, building technology tools. Just like you're going to hear from every company that you talk to that AI is revolutionizing their business. It's revolutionizing ours too.

And as a result, we can do what we love to do, both in Colossus and Positive Sum, which is we're talking about this phrase of highly adaptable forces of nature, the sorts of people that we're attracted to, the life's work idea that we're always talking about. But these highly adaptable forces of nature attacking some domain, whatever that domain is, have been rocking it.

And we love searching for these people and then backing them with influence and distribution and capital and research support and any other ways that we can conceive of. And I think we're in the best position right now to do that that we've ever been. It feels like all the stuff we want to do, all the stuff on our strategy sheet as the three of us talk about building the firm, are incremental down the same roads that we're down. It feels like we're down the right roads.

It feels like a great position to be in. We have lots of ideas for how to get better, and we'll always want to do that. But it also feels like we're able to prosecute pipeline and ideas and win access when we want it and be aggressive and be at the frontier ourselves in a way like we have not before.

ALISON

Yeah, it feels to me like we're in a really good place with the team where we have great people and with really clear ownership over something specific. And we'll talk more about some of the ways we're encouraging people to be even more high agency in their work. But it's already just happening with the quality of the team.

I think it's worth talking to Patrick about a new initiative that Brie on our team and a new team member, Camille, are leading as another piece of the flywheel we're building and, and how it fits into everything else we're doing.

PATRICK

The reminder to set first about Brie's incredible talent. I don't know that I've met anybody as good as having their finger on the pulse of the technology world and sort of where talent is going and what messages and narratives are resonating in the marketplace.

And the thing that Brie has always loved to do is to help companies find that message, position that message, disseminate that message in the world. And she's done that for us, she was the person that stood up Colossus two years ago now. She's done it for all the other companies she's worked for. And as we've continued to find the perfect setup for her here with us, what we've decided to do in partnership with a new team member, Camille Ricketts, who joined us this quarter, is to set up a small new business that is owned by Brie and Camille and also in part in minority by us at Positive Sum that we're calling Merlin.

And the idea behind Merlin is that they offer as a service exactly what I just described. They work for companies trying to position themselves and tell their stories in the marketplace and use Brie and Camille and their, I would argue, very singular talent for doing this to win the hearts and minds campaign that's become so incredibly important for fast-growing startups.

And so what that means functionally for us is that they're spending a lot of their time in and with companies. The expectation is that they are feeding us investment opportunities, which they've been doing at extremely high velocity and, and often very early in companies' life cycles and trajectories.

And then they're doing hands-on work with the companies to support them. It's exciting for us because I feel like we get all the amazing benefits of those two extreme talents, but we've also helped set them up for operationalizing the thing that they love to do, that they want to do all day, every day, working with the most interesting and important companies in technology today.

Last thing I would say on Merlin is that the crossover into our two franchises of Colossus and Positive Sum is just extremely well aligned. So already many stories that we've decided to write and tell in Colossus have been born out of insights from Brie and Camille on what is the most interesting, which again, hopefully the theme you're hearing is like everything is about how do we get to the frontier and understand it faster than others and teach the world about it in a way that nobody else can or does.

So they're helping tremendously on the Colossus side, including for writing for Colossus. And then on the Positive Sum side, the way that we're engaged with them there is that they both have carry in the fund. They are highly incentivized to ship us the most interesting company opportunities that they see.

They're not really investors. They wouldn't call themselves investors making investment decisions, but they're extremely good at identifying companies which might be interesting to Positive Sum. And so by incentivizing them through carry through the funds and exposure through Colossus, while they also do their thing with companies, I just feel like we've created a win-win situation for everyone involved.

ALISON

Yeah, one thing we've seen is that the world really wants help with storytelling right now. Every-

one is realizing that the best story wins, and that being able to tell it is critical to any company's success. And Brie and Camille are two of the best people in the world at helping shape stories. We've had this ability to share people's stories and also to invest behind their stories, and now we have a way to actually help develop them as well, which feels like a really nice tie-in to everything else we're doing, and we're really excited about that.

The other thing we've been working on this quarter, as we've kind of gotten the right team in place, all focused on specific things that all fit together in a very clear way, is enabling that team to have more leverage through technology. Donald, will you tell us about what's been going on on the technology side of the firm, both through our new product, Conveyor, and also Hubble, and how that's enabling the team to do even more of their best work?

DONALD

Over the past quarter, we've really spent our time focused down on two primary ways of leveraging technology to accelerate our work. The first is Hubble, of course, which most are familiar with. We actually just revamped it last week. We opted for a completely clean sheet design focused around the in-depth research work that we do.

I'll share more next quarter on this, but I do want to talk a little bit about this new platform that we've built called Conveyor that allows anyone on the team to use AI coding tools to build and share fully secure production-grade applications connected to all of our data way more easily than you could with Claude Code or Codex or any of the sort of off-the-shelf coding tools.

We launched Conveyor to the team about a month ago, and we've already built more than fifty applications shared across the team from things that help us automatically monitor market signals to analytics dashboards for the media business. And what's been really interesting as we've gotten farther into this experiment is we're also starting to see this very interesting emergent trend of people running with creative ideas that I couldn't have predicted at all, and turning those into full-fledged applications that are then shared with the rest of the team.

A lot of really creative things around how we identify really interesting early-stage opportunities or how we identify emerging stories on the media side. The upshot is we've already spent more than three billion tokens building Conveyor apps. Patrick has actually built more than fifteen applications himself.

That being said, he's not even close to the top of our internal leaderboard in terms of tokens spent. But in general, we're, we're in early stages on Conveyor, but we've already seen really explosive usage across the board, across the team, and really excited for more to come.

Fund III Update

ALISON

Let's quickly talk about the Fund III portfolio. It was actually a relatively quiet quarter for new investments. We had a number of small, either new or follow-on investments that you can read about in the materials. We also closed the remainder of our investment in a seed stage company called Witan Labs.

We'll talk more about pipeline shortly, but I think for this quarter, no material updates to talk about in the fund. Q2 will be quite a busy quarter, I expect, for new investments, and we'll share more about those in our next update.

So after a fairly quiet quarter for investments in Q1, it feels like things are quite busy again, as is often the case.

Patrick, can you give a sense for what's in the pipeline today, what you're seeing, what's caught your attention? lately from the investing side?

PATRICK

Maybe the most important point to make is I think there was a four-week stretch where I was in San Francisco every single week, and as a team, we've been very truly bicoastal, effectively splitting team hours between San Francisco and New York City.

It feels like between the two cities, basically everything that we're interested in is in one of those two places. And I was joking with my wife, we're building some potential plans to go spend a lot of time in San Francisco this summer when the kids are off school. And the opening explanation of it was, if you study history in these periods of condensed explosion and progress and genius, you know, if you study the Renaissance, the thing to do was go to Florence, and undoubtedly Florence is San Francisco right now.

That's maybe the first important point about the pipeline, is that it is predominantly in the Bay Area. In terms of the domains that are interesting to us, we're in the process of seeding a robotics company where we'll be the first money into the business. We're in the process of being the first institutional check into a technology company that it's oriented around live events, which we think is a really interesting category in a sort of post-AI, post-AGI world, that people will treasure these events, but also that the technology needs to be reimaged. So we're seeding a company in that space.

And then the beautiful thing about the pipeline right now, and I would just say the world in general, this just reflects what's going on in the world, is you have these highly adaptive forces of nature type investors or type founders attacking big domains that haven't been touched in a long time.

Donald and I talked to a very talented, interesting founder, we ultimately didn't invest, who was building something in the CPU space. Like when's the last time someone tried to be innovative in the CPU space? It's been a while. And the reason is that we need innovation everywhere because there is so much demand for energy and tokens and inference and new applications of AI and efficiency.

These things all tie together, so we've seen things in the power space, many things in the robotic space. Obviously, tons of AI applications and ways of applying this technology. AI infrastructure companies like Cognition might belong there that we've invested in in Fund III last year. All of these categories are big, substantial, and have fantastic founders going after them.

And so I would just say it's sort of an embarrassment of riches right now that the founders are great, better than we've ever seen, but also the problem spaces that they're tackling are bigger

than we've seen before. But I would just say it feels like even in the bio/life sciences world, where people are trying to build novel token generation factories to do scientific super intelligence, which I think is going to work, I just think there's so many audacious attempts to build big companies right now in and around technology, and we're exploring them all.

So that's what the pipeline feels like, talented founders taking big, audacious swings at domains that haven't been reimagined in a long period of time, where AI is the thing either driving or enabling that exploration. The other defining attribute of our pipeline, and again, of the world, I don't think we're particularly special here, is that everything I just described is true across stages.

We're seeing those kinds of founders attack problems where the company was incorporated a few months ago, and we're seeing companies attack these problems where it feels, and I think by the math, is tremendously early, even if the company has hundreds of millions of dollars of revenue. And I think to repeat the obvious that, like what we're seeing out of the big labs, their revenue growth and their growing margins is that companies are just operating at a scale that was not possible before.

And I think this is gonna hold true across lots of different subsectors. By definition, we are sort of interested in anything at any stage that has these criteria, this great life's work founder, a huge and explosive market, the remaining asymmetry in the bet. Sometimes it does feel a little bit like whiplash to talk to somebody receiving something at thirty million dollar post-money valuation right now or thereabouts.

We're exploring around at a multi-billion dollar valuation right now, and the energy of those two companies feels remarkably similar. Whereas five years ago, the energy of those two companies would have been wildly different. And so I find that fascinating, and I'm sure everyone listening is seeing that across their own portfolios, across their GP's portfolios.

But it's definitely defined our experience as well. And the unifying thread for us is, are we getting to the very best people building the most important things? If so, we wanna spend a lot of time with them and do our research underwrite to see how much upside we think exists in the business. But it definitely does have that feeling of context switching from a thirty million dollar to a twenty billion dollar company in an hour is much more common than it would've been a couple years ago.

And by the way, it's very notable to me that something like Anthropic, which as of last I heard, was something in the ballpark of forty-six billion dollars of run rate revenue growing north of a thousand percent a year, is currently raising money at twenty times revenue, which I'm not saying twenty times revenue is cheap, but for a company growing that fast at that scale, we've just never seen it before.

But I do think that ultimately we're in the midst of just an incredible probably period of explosive technology that we may never see again. Or maybe it'll just keep getting crazier and we really are in some sort of AI takeoff. But I think the result is you need to be willing to look at these companies, meet them where they are, and that's what we're trying to do.

ALISON

As we mentioned last quarter, we were nearing another close for the fund.

We did hold our fourth and final close in March, bringing the total raised for the fund to almost exactly three hundred million, just slightly above, so hitting our target right where we expected to be.

And with that, thank you as always for your partnership. Feel free to reach out anytime with thoughts or questions, and we'll talk to you again soon.

Backing founders pursuing their life's work.

Deal Background

Sourcing

We were introduced to the founder through a friend and fellow investor.

Investment Drivers

January had demonstrated strong traction with its early customers, going head to head against legacy debt collectors and earning significant wallet share. The team took a digital-first approach from day one and has built up a robust dataset allowing for the effective use of AI throughout the business, which competitors will not be able to easily replicate.

Our Edge

Our team developed a strong relationship with the founder during the diligence process and earned the right to invest by being helpful to the company before we wrote our check.

Deal Background

Sourcing
We first met Zach, the founder and CEO of Base, through the podcast and mutual friends (Zach has been a longtime listener).

Investment Drivers
The residential battery market is growing quickly and we believe that Base has the opportunity to win this massive market. Base is pursuing end-to-end battery verticalization to drive costs down and build a strong, new consumer brand. If successful at scale, Base will drive amazing outcomes for homeowners, and become a large stabilizing force for the electric grid. Zach and his team have been extremely thoughtful in how they’ve designed their product and business, are deeply committed to bringing a reliable and affordable home energy service to consumers, and are unparalleled in their ability to marshal resources towards that mission.

Our Edge
Our quick and deep underwriting of the company through our research platform, and our ability to shape and share their story with our audience.

Deal Background

Sourcing

We met Dave and Ridgeline in 2019 while Patrick was running OSAM, as a prospective customer. We’ve kept in touch since, and began serious discussions about investing almost two years ago.

Investment Drivers

Ridgeline has been at the vanguard of implementing AI that customers actually use, and have built a system of record that allows real time views into all of an investment manager's data and systems, bringing an industry on antiquated technology into the modern software world. Founder Dave Duffield is one of the great software entrepreneurs and has built an exceptional team.

Our Edge

Our unique ability to help them grow their business through our network and audience of investors and asset managers.

Deal Background		
Sourcing We were referred to Fortell through our close relationship with Thrive.	Investment Drivers We believe that Fortell's product is a genuine technological leap in the space, and that will allow for the disruption of incumbents in this \$20Bn+ market. The company's D2C go-to-market approach allows them to bypass the traditional audiologist distribution channel and instead earn tech-company economics.	Our Edge Our close relationship with other investors in the company, as well as our quick and thorough underwrite, got us access to this deal.

Deal Background

Sourcing

We were referred to Physical Intelligence by one of its founders, whom multiple people on our team have known for many years, after we released a deep dive on the robotics space in Colossus.

Investment Drivers

Physical Intelligence is aiming to build the general foundation model for robotics. They have remarkable talent density and a data flywheel plan that, if successful, will allow them to be a one-of-a-kind company in the robotics space and earn outsized returns.

Our Edge

Our expertise in robotics, demonstrated in Colossus, and prior relationship with the founding team both earned us the right to invest and gave us conviction in the opportunity.

Deal Background

Sourcing

We were introduced to the founders through our close relationship with an early and involved investor.

Investment Drivers

AI coding agents are a rapidly growing part of the AI ecosystem, and we believe Cognition is taking a unique go-to-market approach by focusing on the enterprise segment. If Cognition can embed with and replace bloated software teams with enterprise-grade performance and security, the revenues will be extremely high quality. We also believe the founding team has strong market-fit.

Our Edge

Our ability to help grow awareness of Devin, particularly among potential banking, finance, and investment customers earned us access to this deal.

Deal Background		
Sourcing We knew the founder from overlapping professional experience and they were big fans of <i>Invest Like the Best</i> .	Investment Drivers Witan Labs is a seed stage investment, so our biggest investment driver was the founding team, all of whom we believe are talented and good fits for this problem. We also think that our research and distribution will allow us to help the company succeed as they go to market.	Our Edge Our personal relationship with the founding team, their following of the podcast, and our ability to eventually raise awareness amongst their ideal customer profile, allowed us to win this deal.

PSum investment

Deal Background

Sourcing

We were introduced to Bernard by another pre-seed investor that we know well.

Investment Drivers

The founding team has a strong software background, and we believe the trades market is both underserved and large, so the opportunity is large if the team is able to find product market fit. We felt that investing in this early SAFE round would give us a chance to get to know the team better and earn allocation as the company grows.

Our Edge

Our longstanding relationship with one of the other pre-seed investors got us access to this investment at its inception.
